

Fully Automated Eye-Letting & Threading Fabrication Process

Lynx has fully automated their fabrication process system, which includes Eye-Letting and Threading with an aim to drastically increase the production output.

Compared to the manual way of putting the eyelet, through the automated process the shape of the eyelet remains perfect without any damage to it and so gives a perfect look to the end product.

In the case of threading it gives a perfect knot with the automated process and also the size of the balance string (both sides) is the same, whereas in the manual process there is still a chance of a miss-match.
